## SEER Rocksoil and SEER Rockdust

Using 1 ton of peat free **SEER Rocksoil** we grew on 4,000 marigolds plugs this year and compared their progress against 7,000 marigold plugs from the same supplier that we grew in a standard issue peat based compost. We added Polyon 47 slow release fertiliser to both.

I am pleased to report that **SEER Rocksoil** performed as well as the peat based compost. As the photos show we got more flowers and better plant growth with **SEER Rocksoil** and better root growth with the peat based compost (not necessarily a bad thing). I found the SEER Rocksoil to be heavier than the peat based compost that will be a transport issue.

**SEER  
Rocksoil  
on right in  
both photos  
show better  
plants with  
less root  
growth.**

The above trial is especially interesting, as I had previously used **SEER Rockdust** as an additive with peat based compost for Polyanthus and found the root growth to be improved.

You have two valuable products here with a lot of potential and I have little hesitation in recommending them to other nurseries.
